SUBCELLULAR LOCATION: Type I membrane protein.

TISSUE SPECIFICITY: PLACENTA, LUNG, HEART, AND
SEEM TO BE EXPRESSED IN PANCREAS AND BRAIN.

SIMILARITY: BELONGS TO THE CSF-1/PDGF RECEPTOR
PROTEIN KINASES.
                                                                                                                                                                                                                                                                                                                                                                                          SIMILARITY: CONTAINS 7 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAINS.

COFACTOR: P700 is a chlorophyll A dimer, A0 is chlorophyll A, A1 COFACTOR: P700 is a chlorophyll A dimer, a0 is chlorophyll A, A1 is a phylloquinone and FX is a 4Fe-4S iron-sulfur center.

SUBUNIT: A psaA/B heterodimer binds the P700 chlorophyll special pair and subsequent electron acceptors. The PSI reaction center higher plants and algae is composed of one at least 11 subunits. SUBCELLULAR LOCATION: Integral membrane protein. Chloroplast thylakoid membrane.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel peptides which bind to antibodies which CC recognise the Toxoplasma gondii P30 envelop protein. A peptide library CC was generated to express pentadecapeptides on the surface of a CC filamentous phage as a fusion protein with the PIII protein. The library CC was screened with immobilised anti-T. gondii P30 protein antibody lEIE7. CC Phages which bind this antibody were recovered and amplified by one CC round of infection in E. coli. The resultant phages were rescreened with the immobilised antibody and the second round screen isolated S8 CC bacterial colonies infected with phage. Of the 58 colonies, phage DNA CC from 30 colonies infected with phage. Of the 58 colonies, phage DNA CC from 30 colonies moded. The peptide sequence of CC the pentadecapeptide encoded. The peptide sequences AAMI2276-86 were CC clentified. Of the 30 colonies studied, this peptide sequence was compensated a template peptide sequence (AAMI2287) corresponding CC pentadecapeptide was used to generate a series of overlapping CC pentadecapeptides. These peptides were used to determine the best peptide sequence which binds the IEIE7 antibody. Peptides AAMI3367-75 CC were isolated. The new peptides can then be used in diagnostic assays to detect T. gondii antibodies in a sample or to purify anti-P30 antibodies or for active immunisation against T. gondii.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                            AAW71332-36 represent glycolipid sugar chain replica peptides. They react specifically with an antibody against glycolipid sugar chains and inhibit adhesion and metastasis of cancer cells to a target cell. The peptides can be used to prevent cancer metastasis.
                                                                                                                                                            New peptide

                                      The invention relates to a monoclonal antibody (MAb) to lipoteichoic acid cof gram positive bacteria, where the MAb is a chimeric immunoglobulin cc comprising at least part of a human immunoglobulin constant region and cc at least part of a non-human immunoglobulin variable region having capecificity to lipoteichoic acid of gram positive bacteria. The cc antibodies bind to whole bacteria and enhance protection from lethal infection. The antibodies corpeptides (encoded by a DNA of the variable region of anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or cc acid antibody or characterised by amino acids corresponding to one or cc of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating or preventing infections cc caused by gram positive bacteria. They can also be used for the diagnosis of specifically claimed lipoteichoic acid epitope peptide mimic that can be cc bound by the antibody of the invention (Mab 96-110).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The present invention describes a vehicle-peptide molecule (I) or its comultimers. (I) can have antiinflammaticy, antitumour, immunosuppressive, cytostatic, antitrheumatic, antiarthritic, antidiabetic, ophthalmological, antianaemic, anorectic, antiinferthilty, haemostaric, dermatcological and consurprotective activities. (I) can be used as a therapeutic or compondition of contrological and consurprotective activities. (I) can be used as a therapeutic or compondition of interest, for identifying normal purposes. (I) is useful for contein of interest, for identifying normal or abnormal proteins of interest, for identifying normal or abnormal proteins of interest, as a part of diagnostic kit to detect the presence of their conteins of interest in a biological sample. Additionally, (I) is useful conteins of interest in a biological sample. Additionally, (I) is useful conteins of inflammatory and autoimmune diseases, tumour growth, cancer, infertility, and neurological degenerative diseases, tumour growth, cancer, confinetic compounds are useful for treating disorders characterised by compounds and continuents. The TPO-mimetic comprising compounds are useful for treating disorders characterised by compounds and continuents. The treating d

                                                                                                                                                                                                    Š
                                                                 밁
                                                                                                                                                                                                                           The invention relates to a monoclonal antibody (MAb) to lipoteichoic acid of gram positive bacteria, where the MAb is a chimeric immunoglobulin comprising at least part of a human immunoglobulin constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteichoic acid of gram positive bacteria. The antibodies bind to whole bacteria and enhance phagocytosis and chiling of the bacteria and enhance protection from lethal infection. The antibodies or peptides (encoded by a DNA of the variable region of anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for the diagnosis of gram positive bacteria infections.

CC Sequences AAW94726-34 represent common peptide sequences resulting from all library panning experiments. Three series of panning experiments were conducted to identify peptide sequences to which antibody of the invention (Mab 96-110) bound strongly. The translated sequences provide lipoteichoic acid epitope peptide mimics to which Mab96-110 bound.
                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                   The invention relates to a monoclonal antibody (MAb) to lipoteichoic CC acid of gram positive bacteria, where the MAb is a chimeric CC immunoglobulin comprising at least part of a human immunoglobulin CC constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteichoic acid of gram positive bacteria. CC rhe antibodies bind to whole bacteria and enhance phagocytosis and CC killing of the bacteria and enhance protection from lethal infection. The artibodies or peptides (encoded by a DNA of the variable region of CC anti-lipoteichoic acid antibody or characterised by amino acids. CC corresponding to one or more of the complementarity determining regions CC (CDRs) of the variable region of the antibody or an be used for treating CC or preventing infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacteria infections. CC Sequences AAM94705-22 represent sequences resulting from a 15mer library CC panning second experiment. Three series of panning experiments were CC conducted to identify peptide sequences to which antibody of the C invention (Mab 96-110) bound strongly. The translated sequences provide CC lipoteichoic acid epitope peptide mimics to which Mab96-110 bound.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a monoclonal antibody (MAb) to lipoteichoic acid of gram positive bacteria, where the MAb is a chimeric immunoglobulin comprising at least part of a human immunoglobulin variable constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteichoic acid of gram positive bacteria. The antibodies bind to whole bacteria and enhance phagocytosis and killing of the bacteria and enhance protection from lethal infection. The antibodies or peptides (encoded by a DNA of the variable region of anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the variable region of the complementarity determining regions or peptides and corresponding to one or more of the complementarity determining regions corresponding to the complementarity determining regions or peptides are considered by the complementarity determining regions corresponding to one or more of the complementarity determining regions or peptides determining regions corresponding to the complementarity determining regions or peptides determining regions corresponding to the complementarity determining regions or performing the complementarity determining th

                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                   or preventing infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacterial infections. Sequences AAW94705-22 represent sequences resulting from a 15mer library panning second experiment. Three series of panning experiments were conducted to identify peptide sequences to which antibody of the invention (Mab 96-110) bound strongly. The translated sequences provide lipoteichoic acid epitope peptide mimics to which Mab96-110 bound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antibodies to lipoteichoic acid of gram positive bacteria - used to develop products for the diagnosis, prevention and treatment of infections caused by gram positive bacteria
